

A word from our Chief Technology Officer

Water is a necessity of life and a foundation for healthy communities and strong economies. Everything we do requires water, and everything we do can impact our precious water resources. Wastewater occurs as a result of industry and can ultimately affect our drinking water, causing health concerns and requiring expensive treatment that raises the cost to consumers and communities.

For decades the process for turning wastewater into drinking water has been available. However, there has been little will to use that process because it has simply not been cost effective.

IHS designs unique processes that bring together both wastewater and drinking water treatment technologies to make those processes *better, cleaner, and cheaper*, while allowing a rapid return on investment. The IHS team has over 30 years of water treatment experience and makes all of its treatment units mobile. IHS designs these plug and play units in a way that meets the requirements in all 50 states. From our water recycle and reuse project in the Grand Canyon, to our commercial wastewater treatments in beef processing plants and in mini malls across the nation, the IHS goal remains the same: Drinking water standards. No one else in the market place is doing what IHS is doing.

Whether you operate an Oil Services Company, a man camp, or a small community, IHS will help you to reduce your cost of operation, streamline and improve efficiency, increase environmental compliance, and increase your profits.

Cheers,
Senator Mike Jungbauer
IHS Chief Technology Officer
